

The Efficient Workplace

A Leading Automotive OEM increases Paint process efficiency & worker safety

Problem

- New paint system installed in paint line and rework spray booths to increase productivity, coat appearance and reduce VOCs and waste
- System contains Isocyanates that represent a health risk to painters
- Current textile re-useable coveralls do not guarantee painters safety against Isocyanates.
- Current textile re-usable coveralls are covered in dry paint and represent a potential source of process contamination

Countermeasure

Use a protective garment solution that:

- has been tested against exposure to Isocyanate based paints without compromising protection
- is disposable and will provide a clean protection solution that also reduces the risk of cross contamination that potentially exist with a re-usable solution

➤ **KLEENGUARD* A30 Coverall**

Results

- **Improved safety compliance** by providing a solution certified to protect workers against Isocyanates
- **Support LEAN manufacturing principle** by providing a solution that will minimise risk of process contamination
